

Takes the hard work out of handling those difficult loads.

About this clamp

The Series 4 fork clamp can be used to clamp loads between the forks, or they can be extended beyond the width of the carriage when handling extra wide loads, or narrowed down to fit small pallets or stilliages.

The open centre frame design provides a clear view of the load through and around the arms, so improving productivity and allowing faster truck operation.

Hi strength alloy steel castings are used to joint the fork arms to the 'C' section arm carriers, resulting in a stronger, stress free join for those demanding operations.

'Regenerative' control valve with pressure relief and new cylinder designs allow these clamps to work longer and at higher pressures.

Features

- Fast operating speed for improved productivity.
- New unitised frame made of extruded steel sections.
- One piece frame bearings for increased service life.
- Hydraulic cylinders are set well into the frame for protection.
- Open centre frame for improved driver visibility.
- Bolt on mounting group for easy attachment interchange.
- Regenerative hydraulic valve for faster arm speed.
- 20 % larger bearing surface for longer bearing life.
- Optional fork sizes to suit all types of loads.
